# TRANSFORM YOUR APPROACH TO TRADING AND RISK MANAGEMENT

Relative	Expiry	Start	End	Value	Change
LNG - Liquefied Natural Gas based on Henry Hub and Costs		4/1/2018	4/30/2018	7.779	
				7.808	

# Real-time forward curves give you **unparalleled market price visibility** to enhance trading activity and improve accuracy and timeliness of portfolio valuation and monitoring.

Today's traders and risk managers often build forward curves based on the previous day's settlement prices which do not reflect subsequent market movements. This may lead to erroneous indications of market liquidity and inaccurate valuation of a position. By comparison, real-time curves provide traders with robust, up-to-date pricing, which is especially required for thinly traded hubs, delivery dates, products, or spreads. These curves can be shared with the risk team for more accurate and timely valuation of a position.

Automating the generation of real-time curves also provides the price signals to fuel an organization's algorithmic trading strategies, which is a growing trend in the market.

# HERE ARE THE 3 GROUND-BREAKING INNOVATIONS OF OUR FORWARD CURVE TECHNOLOGY THAT WILL TRANSFORM YOUR TRADING AND RISK STRATEGIES:

## 1. Our Curves Move in Real-Time

The potential value of real-time pricing is old news, but realizing that value still eludes many organizations. End-of-day prices are stale and do not reflect current market conditions, and are insufficient for intraday marking.

Real-time curves create increased transparency into intraday trading opportunities while providing trading and risk professionals the ability to value positions on a timelier basis.

Marketview's integration of CurveBuilder into its web platform will bring transparency to a new paradigm, with the ability to build millions of real-time curves per day, and more than 1,000 curves per minute. Leverage this unparalleled visibility for intraday trading opportunities and see measurable improvements to your performance.

## 2. Build Your Curve the Way You Like It

Our curvebuilder is equipped with a rules engine to build custom curves using whatever methodology you choose. You can construct purpose-built curves to account for seasonality, holidays, overlapping tenors, crack spreads, missing prices, thinly traded hubs or products, and many more challenges, and even build additional curves to cover “what-if” scenarios. Traders can’t make smart trade decisions when they lack pricing for differentials, certain hubs, or future delivery dates.

## 3. Eliminate Silos Between Trading and Risk

All too often, traders will generate curves that risk managers can’t easily access and vice versa. This means the risk team has a difficult time reconciling the support for the trade, marking the position and understanding the impact on the P&L. CurveBuilder allows both teams to access the same data sources and share forward curves. These curves retain a full audit trail of all changes and methodologies, making compliance easy, and the curves can be fed into downstream ETRM systems for invoicing and other accounting functions.

End the reliance on complex excel spreadsheets which are over-written every day, and experience the simplicity of compliance with MarketView CurveBuilder.

By monitoring the market, Drillinginfo continuously delivers innovative energy solutions that enable our customers to sustain a competitive advantage in any environment. Drillinginfo customers constantly perform above their competitors because they are more efficient and more proactive than the competition.
